STEP 11 — Result Analysis

The Transformer-based BERT model significantly outperforms traditional Naive Bayes and CNN models in sentiment classification. Pre-trained contextual embeddings allow the model to understand word meaning based on surrounding context. Unlike bag-of-words models, BERT captures bidirectional relationships between words. This improves classification performance especially for complex sentences. The fine-tuning process adapts the pretrained knowledge to the IMDb dataset effectively. The model achieved high accuracy and F1-score, demonstrating strong generalization. However, training required high computational resources and GPU acceleration. Memory consumption is significantly higher compared to CNN and Naive Bayes. Future improvements may include hyperparameter tuning and using larger models like RoBERTa.

STEP 12 — Lab Report Structure 1.Aim To implement Transformer-based text classification using BERT.

2.Dataset Description IMDb dataset with 50k reviews (binary sentiment).

3.Preprocessing Steps Tokenization, padding, truncation, tensor conversion.

4.Model Description BERT-base-uncased fine-tuned for sequence classification.

5.Training Configuration LR = 2e-5, Batch size = 16, Epochs = 2.

6.Evaluation Metrics Accuracy, Precision, Recall, F1-score, Confusion Matrix.

7.Results ~90%+ Accuracy.

8.Conclusion Transformer models provide superior performance due to contextual embeddings but require high computation.
